

disc brake pads

Thank you for purchasing this pair of Jagwire replacement disc brake pads. Jagwire disc brake pads are made with a semi-metallic compound that provides powerful, quiet, long-lasting performance. Our exclusive compound also features HeatShield™ technology that resists heat build-up and stays cooler, providing superb braking control in critical situations that normally cause pad overheating and fade. More than a replacement, we think you will find the fit and function of Jagwire disc brake pads second to none, and an upgrade over OE performance.

WARNING: Brake pads are a part of your braking system. Failure to install these pads correctly could cause failure of your braking system while riding and subsequent injury or death. If you don't fully understand any part of these instructions or don't possess the tools or skills to perform this installation, please pay a professional bicycle mechanic to install these brake pads for you. Your life could depend on it.

Tools needed: Varies by brake manufacturer.

Installation instructions:

Installation

Jagwire disc brake pads are available for many different brands and models of disc brakes, and are a direct replacement for original equipment. Pad removal and installation procedures vary greatly among brands and individual models; please refer to the OE instructions provided by the brake manufacturer.

Please note that in certain instances, when installing Jagwire disc brake pads on particular brands and brake models, it may be necessary to reuse the original factory pad retention spring.

Maintenance

Check your brake pads and all components of your braking system before every ride. Replace pads that have become damaged in use or that have become worn past the adjustability of the brake.
